The prior art fails to teach a combination of all the claimed features as presented in claim(s), wherein the claimed invention comprises, in claim 1, an acousto-optic modulator (AOM) which during use receives the array of input beams and separately modulates each of the received beams in accordance with an AOM control signal to produce an output beam array that is scanned over a scan region by the scanning system; and wherein said errors attributable to at least one of (1) variations in beam velocity over a scan line within the scanning system, (2) intensity errors associated with the scanning system, and (3) intensity variations from stripe deflection across a sound field within the AOM, in claim 12, a deflection measurement circuit including a chevron pattern detector across which one of the beams of the scanned array of beams scans during operation, said chevron pattern detector generating a signal that is a measure of the location of the scanned array of beams in a direction transverse to the scan direction, said chevron pattern detector including an angled slit across which said one of the beams passes, as claimed.
